

## OHP Thrips Cocktail™

2012 Edition

The most important aspect of thrips management is to have a scouting and monitoring program. By using such a program you will be able to keep track of population trends. This will help you decide not only how often to apply pesticides but which pesticide or tank mix to use. Most of the pesticides and tank mixes are best used when thrips numbers are low and are found only on leaves and not in flowers. A monitoring program should include sticky traps, indicator plants and plant inspections. As with controlling any other insect or mite pest problem, results will be better if thrips numbers are low to begin with. Help your pesticide program out by promptly removing unsold or old plants. Keep weeds to a minimum inside and around the outside of the greenhouse or nursery. Screening greenhouse vents and doors will help exclude thrips. Your goal should be to prevent thrips numbers from building to damaging levels.
